This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cycosine methylation status in chemically pretracted genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABIR2073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide SEQ ID NO 6995 for detecting SNP TSC0002084.
                                                 oligomers. The oligomers may be used as research reagents, treating disease caused by undesired production of proteins and for diagnosing and treating AIDS and atherosclerosis.
                                                                                                                                                                       1.2%; Score 13; DB 1; Length 13; 100.0%; Pred. No. 6.7e+02; tive 0; Mismatches 0; Indels

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

```

This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABR180793 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at 0 Length 13; Sequence 13 BP; 1 A; 0 C; 3 G; 9 T; 0 other; ffp.wipo.int/pub/published_pct_sequences.                         This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, acadiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC09010-ABC9989, ABF00010-ABF9989, ABH00010-ABF9989 and ABL00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a cange of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE09999, ABF0010-ABE99999 and ABI00010-ABE8071 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE09989, ABF0010-ABE09989 and ABE00010-ABE09989, ABF0010-ABE9989 and NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPPO at

```

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cycosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABF89989, ABF00010-ABF9989 and ABS00010-ABF89073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The Oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABIG0013-ABH32073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from NIPO at oet or oligonucleotides, useful for diagnosis and cell typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status Claim 1; SEQ ID 22370; 29pp + Sequence Listing; German. ftp.wipo.int/pub/published_pct_sequences. ```
ó
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABE99899 and ABE00010-ABE99899 and SEGOODIO-ABE9989 and SEGOODIO-ABE9998 and SEGOODIO-ABE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The ABC0010-ABC9989, ABF0010-ABF9989, ABH0010-ABH99989 and ABI0010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                  Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single nucleotide polymorphisms and cytosine

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The ABCOOGIO-ABCO9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABIO010-ABF99899, ABF00010-ABF99989, ABH00010-ABH99989 and NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABF99989, ABH00010-ABH99989 and

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic (SNP) oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The ABC00010-ABC99899, ABF00010-ABH99999 and ABI00010-ABR29989, ABH00010-ABH99999 and ABI00010-ABR29989, ABH00010-ABH99999 and NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
            NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
ABI00010-ABI82073 represent the oligomers described in the invention.
                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABI00010-ABI82073 represent the oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE09989, ABF00010-ABE99899, ABH00010-ABH99989 and ABI00010-ABE9989, abenefice oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell.type differentiation. ABC00010-ABE09989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 13 BP; 8 A; 3 C; 0 G; 2 T; 0 other;

Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject Claim 2; Page 34; 276pp; English.

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma,

retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention. 88888888

The method of the invention is useful for identifying HSCs and for exploring, for e.g., the conditions to expand HSCs in vitro, and to identify signal molecules that control HSC expand HSCs in vitro, and to identify signal molecules that control HSC estal-remain and lineage commitment, which may provide improvements in current bone marrow transplantation and leukemia therapy. The present sequence relates to a soly(T) tail used in an amplification method shown in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying hematopoietic stem cells, by targeting two reporter DNAs into two different genomic loci of hematopoietic cells to produce targeted cell population, and selecting cells under specific survival

The invention relates to a method of targeting DNA sequences, which comprises hybridising to the double stranded nucleic acid target sequence at least a first recombinase coated single stranded nucleic acid probe comprising a homology clamp that is substantially complementary to one strand of the target nucleic acid sequence. The DNA analogue probes are useful in: activating and increasing the efficiency of DNA targeting by recombinase-coated nucleoprotein flaments, modifying DNA sequences in target DNA (in vivo and in vitro), activating homologous recombination, increasing the stimulation of DNA repair enzymes to excise target DNA sequences, and sequences, gene cloning, gene family cloning of target DNA sequences and mutagenesis in target DNA, the stimulation of DNA repair enzymes to excise target DNA sequences appeared to a activating cloning, flowed-logous linear genomic DNA. The compositions may also be used in site-directed modification of transgenic plants and animals, for gene activation, in correcting disease alleles, in the elucidation of gene function and activity, to alleviate disease states, to create disease models and site specific variants. The methods are useful in genotyphing assays, in detecting pathogens such as bacteria, in identifying nucleotides at a detection position within the nucleic acid target sequence. This polynucleotide sequence represents a PNA (peptide cargement.) Gaps 0; 1.2%; Score 13; DB 1; Length 13; 00.0%; Pred. The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, copon and rectum cancer, connective tissue cancer, cesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, mol-Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, pancreatic cancer, prostate cancer, rhabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, rhabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, rhabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, osesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           non-Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, pancreatic cancer, profette cancer, rabblomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in

The invention relates to DNA sequences (I) that encode six specific plant proteins: (i) a protein (ABP60425) with mitochondrial carrier protein cativity (IIa); (ii) a protein (ABP60427) with reneferrin binding protein activity (IIb); (iii) a protein (ABP60429) with receptor-like protein kinase activity (IIb); (iv) a protein (ABP60428) with elongation carrier protein (IId); (iv) a protein (ABP60428) with non-long terminal repeat retroelement reverse transcriptase activity (IIe); or (vi) a protein (ABP60430) with helicase activity (IIf); (I), also related sequences, derived ribozymes and antisense sequences, expression vectors, encoded proteins and antibodies against the proteins are used to produce plants with altered properties, including tolerance of overwatering. The artibodies are also used for isolation of the proteins and in in including tolerance of overwatering. The immunoassays. Also (I) or their primer or probe fragments are used to screen for terminators and constitutively, aerobically or anaerobically care inducible plant promoters, specifically for use in potatoes and the sequence that encodes (IId) is used to alter the translation profile in captures. Since (I) are derived from potato, their promoters and charactors provide high level transgene expression in potato. With improved tissue specificity and inducibility, and can also be used to improved in the first strand synthesis of cDNAs derived from Potato.
                                                                                                                                                                                                                                                                                                                                                                                    New DNA sequences from potato, useful for producing plants with altered properties, e.g. tolerance of flooding, also related proteins,
                                                                                                                                                                                                                                             (MPBC-) MPB COLOGNE GMBH MOLECULAR PLANT & PROTE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 13 BP; 2 A; 0 C; 0 G; 11 T; 0 other;

Detecting polynucleotides, for pharmacogenetic testing, comprises contacting a target polynucleotide with a complementary single-stranded sensor polynucleotide and an agent that allows the sensor to fluoresce upon excitation

Example 1; Page 25; 41pp; English.

The invention relates to a novel assay for detecting a polymucleotide in a sample, which comprises: contacting a sample suspected of containing a target polymucleotide with a predetermined single-stranded sensor polymucleotide complementary to the target polymucleotide, in a solution comprising an agent that is a nonequeous solvent that allows the sensor polymucleotide, and detectable fluorescence emission. The sensor polymucleotide, and detecraning fluorescence emission. The assay is useful for detecting a single or double-stranded target polymucleotide, such as, DNA or RNA in a sample. The assay finds use in a wide variety of different applications including pharmacogenetic testing, peterning, course of a forensic specimen, in anthropological setting, paternity testing to identify the species or individual which was the source of a forensic specimen, in anthropological setting, paternity testing for compatibility between prospective tissue or blood donors and patients and in screening for hereditary disorders. The method is alsease, drug or medication, and other applications include human population genetics, analyses of human evolutionary history and characterisation of human haplotype diversity. The method is useful for detecting polymucleotide sequences from contaminants or pathogens including bacteria, yeast, and viruses to detect single nucleotide confidences associated with particular alleles or subsets of alleles. The method is useful for detection of mutations and to detect alleles or subsets or alleles. sequence represents an oligonucleotide sequence used disorders including cystic fibrosis, Tay-Sachs, and sickle-cell anaemia. This polynucleotide sequence represents an oligonucleotide sequence used fluorescence technique of the invention. in a

Primers AAX83286-X83329 were used to PCR amplify breast cancer tumour specific clones (AAX83201-X83285 and AAX83331-X83415) which are expressed from a genomic region containing a human endogenous retrovirus (AAX83330). Detection of the clone sequences allows determination of the presence of breast cancer in a mammal. Progression of breast cancer in a be monitored by detecting the level of clone expression. Polypeptides encoded by the clones can be used in vaccines to inhibit or prevent

                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant DNA encoding yeast leukotriene A4 hydrolase - and related vectors and transformed cells, producing yeast hydrolase useful, e.g. as vaccine against Candida infection and as diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a primer for the C. albicans leukotriene A4 (LTA4) hydrolase, cDNA. The hydrolase converts LTA4 to (probably) 5,6-dihydroxy-7,9,11,14-eicosaterraenoic acid, which is less pro-linflammatory than the LTB4 produced by the mammalian enzyme, therefore reducing the immune response to C. albicans. An expression vector contg. the hydrolase cDNA can be used to produce the hydrolase, which can be used to generate antibodies (as diagnostic agents, or for passive immunisation), as a vaccine to treat or prevent Candida infection, as a reagent to detect antibodies and to reduce/modulate an inflammatory response by systemic or topical application. Nucleic acid antisense to the hydrolase cDNA may prevent hydrolase expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents an anchor primer used to convert normal breast and tumour RNA to cDNA. The present invention describes nucleotide sequences which encode human breast cancer specific polypeptides. Detection or measurement of human breast tumour specific polypeptides and nucleotide sequences, or the corresponding RNA in a sample, is used for diagnosis and monitoring of breast cancer. Human breast tumour specific polypeptides and monitoring of breast cancer. Human breast tumour specific polypeptides and nucleotide sequences, and the vectors containing the DNAs, are also useful in vaccines for inhibiting development (for prevention or therapy) of breast cancer. The polypeptides may also be used to raise monoclonal antibodies, used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA coding MSS-1-like protein - useful for developing drug related to gene expression through Tat protein formed at early period of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence of a T12MX PCR primer used for amplification in the method of the invention, involving the use of MSS-1-like protein. The rat-derived MSS-1-like protein is used to develop a drug related to gene expression through Tat protein formed at early period of HIV infection.
                                                                                     This is the nucleotide sequence of a PCR primer used for amplification in the method of the invetton involving the use of cGMP-dependent kinase, used in the method of the invention, where it is used to obtain drugs related to expression of the gene.
                                                                                                                                                                                                                                  ..

```

This is the nucleotide sequence of a T12MX PCR primer used for amplification in the method of the invention, involving the use of MSS-1-like protein. The rat-derived MSS-1-like protein is used to develop a drug related to gene expression through Tat protein formed at early period of HIV infection.

Sequence 14 BP; 0 A; 0 C; 0 G; 13 T; 1 other;

DNA coding MSS-1-like protein - useful for developing drug related to gene expression through Tat protein formed at early period of HIV

WPI; 1998-513901/44.

general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. P450RAI is highly induced by RA in cell lines and tissues. This allows for the development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This allows for the development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying DNA encoding inducible or suppressible cytochrome P450 - by screening for drugs which reduce the catabolism of retinoic acid, useful in cancer chemotherapy and the treatment of acne and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is a 3' poly(T) PCR primer used in the amplification of the inducible cytochrome P450RAI gene which specifically metabolises a derivative of the retinoic acid (RA). The cytochrome P450 gene in general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. P450RAI is highly induced by RA in cell lines and tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3' poly(T) primer; PCR; amplification; cytochrome P450 gene; oxidative metabolism; P450RAI; retinoic acid; RA; promoter; ss.

                                                                                                                                                                                                                               This is a 3' poly(T) PCR primer used in the amplification of the inducible cytochrome P450RAI gene which specifically metabolises a derivative of the retinoic acid (RA). The cytochrome P450 gene in general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nuclectide sequence can be used to induce or suppress the expression of its protein. P450RAI is highly induced by RA in cell lines and tissues. This allows for the development of a drug screen using promoters and nuclectide sequences to identify drugs which are useful for reducing the catabolism of RA.

Several combinations of the polyT primers were used with degenerate upstream primers (see AAV12229-33) for differential display PCR. Bands demonstrating reproducible differential amplifications were found using the primers given in AAV12221 and AAV12231. This PCR product was reamplified (see AAV12234-35). A differential display product (see AAV12213) which exhibited a dependence on the presence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of retinoic acid for its expression was isolated, and was used to isolate a full-length clone (see AAV12203) coding for a novel retinoid metabolising protein (see AAW41S9), designated 2P450RAI.
                                                                                                                                                                                                                                                                 Retinoid metabolising protein; P450RAI; retinoid oxidase, retinoic acid; zebrafish; inhibitor; antisense; cancer; actinic keratosis; oral leukoplakia; head tumour; neck tumour; non-small cell lung carcinoma; basal cell carcinoma; acute promyelocytic leukaemia; skin cancer; acne; psoriasis; acute promyelocytic leukaemia; skin cancer; acne; psoriasis; acute promyelocytic diagnosis; screening; differential display;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer, actinic keratosis, oral leukoplakia, acne, psoriasis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             transcription reactions on polyA+ RNA isolated from the fins of control or retainoic acid-treated zebrafish (Danio rerio). Several combinations of the polyT primers were used with degenerate upstream primers (see AAV1229-33) for differential display PCR. Bands demonstrating reproducible differential amplifications were found using the primers given in AAV1221 and AAV12231. This PCR product was reamplified (see AAV12234-35). A differential display product was reamplified siven in AAV12231 and AAV12231 and AAV12231 and a differential display product caid for its expression was isolated, and was used to isolate a full length clone (see AAV12203) coding for a novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        retinoid metabolising protein (see AAW44159), designated zP450RAI.
                                                                                                    Retinoid metabolising protein; P450RAI; retinoid oxidase; retinoic acid; zebrafish; inhibitor; antisense; cancer; actinic keratosis; oral leukoplakia; head tumour; neck tumour; non-small cell lung carcinoma; basal cell carcinoma; acute promyelocytic leukaemia; skin cancer; acne; psoriasis; ichthyosis; therapy; diagnosis; screening; differential display;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

Retinoid metabolising protein - useful to develop products to treat, e.g. cancer, actinic keratosis, oral leukoplakia, acne, psoriasis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PolyT oligonucleotides (see AAV12217-28) were used in reverse transcription reactions on polyA+ RNA isolated from the fins of control or retinoic acid-treated zebrafish (Danio rerio). Several combinations of the polyT primers were used with degenerate upstream primers (see AAV12229-33) for differential display PCR. Bands demonstrating reproducible differential amplifications were found using the primers given in AAV12221 and AAV12231. This PCR product was reamplified (see AAV12234-35). A differential display product (see AAV12213) which exhibited a dependence on the presence of retinoic acid for its expression was isolated, and was used to isolate a full-length clone (see AAV12203) coding for a novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    retinoid metabolising protein (see AAW44159), designated zP450RAI.

```

This oligo-dr primer was used with a random 10-mer primer (see AAV04014) in an RT-PCR amplification of rat embryo fibroblast REF-112 cell RNA. This was performed in order to identifying novel p53 regulated genes. One transcript that was upregulated specifically in cells harboring wild-type p53 protein was identied. Appreviously uncharacterised cDNA (see AAV04008), the cell regulatory gene CGR11, was isolated. The CGR11 gene and CGR11 protein (see AAW38423) can be used in methods for the diagnosis and treatment

DNA encoding mammalian growth response protein CGR11 or CGR19 -useful to suppress or diagnose cancer, also similar use of SM20 or mEH protein

```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl rydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA1765 to AAA1765 to AAA1765 and AAA1765 and AAA1765 on and AAA1765 on and AAA1765 on and AAA1768 represent their corresponding target sequences; AAA1768 to AAA18185 and AAA1808 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18186 to AAA1908 to AAA19154 represent their corresponding target sequences; AAA19154 represent their corresponding target sequences; CAA419154 represent their corresponding target sequences; AAA1923 to AAA2031 and AAA2150 to AAA2150 and AAA1808 to AAA2180 to A
Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                integrin subunit alpha-6, or integrin subunit beta-3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 14 BP; 1 A; 2 C; 6 G; 5 U; 0 other;

(CORI-) CORIXA CORP.

The present invention describes lung tumour specific polynucleotides and tumour antigens. AAZ07144 to AAZ07246 and AAZ08301 to AAZ08325 represent specifically claimed polynucleotides, and AAY29486 to AAY29571 represent amino acid sequences from the present invention. The lung tumour specific polynucleotides and polypeptides can be used in pharmaceutical compositions and vaccines to inhibit the development of lung cancer. They can also be used to detect lung cancer in a patient. Probes and antibodies derived from the lung tumour sequences are useful in detection of lung cancer. The present sequence represents a primer used in an example from the present invention. New nucleic acid encoding tag7 - used to inhibit tumour growth and induce apoptosis, for treatment of carcinoma, sarcoma, melanoma and leukaemia

Example 1; Page 56; 138pp; English.

This sequence is a PCR primer for DNA encoding the murine tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder,

testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma, sarcoma (Kaposi's, osteo- or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7, as an antagonist of tag7; for isolating tag7 and therapeutically to inhibit or delay tumour metastasis. 88866666688888

Newly isolated nucleic acid molecule (designated p23) encoding a p23 polypeptide - useful for inducing a senescence phenotype in a cell

Example 1; Page 18; 44pp; English.

expression vector for p3 is useful for inducing a senescent phenotype in a cell (preferably eukaryotic). This may help in regulating diseases, including cancer, persistent inflammation, and various proliferative and degenerative disorders. These transgenic cells are useful in gene therapy for treating cancer, particularly where antisense oligomuclectides are useful for blocking normal or mutant p23 expression in cancer cells or other proliferating cells. Transgenic cells are also useful for producing the p23 polypeptide in large quantities. The antibodies are useful for raising antiserum against p23, and for identifying sensesont cells in culture and tissue biopsies. The p23 polymucleotides are useful for modulating or altering p23 activity in a cell, and for identifying and isolating the whole gene encoding p23, and dor identifying and isolating the whole gene encoding p23, and variants of p23. Assays based on p23 elements, which detect p23 levels and activity are useful as diagnostic markers for staging tumours, determining prognosis, and/or predicting therapeutic success. These elements also provide an assay for detecting chromosomal rearrangements in chromosome 3 in a human cell. The isolation of the p23 polynucleotide The present invention describes human senescence factor p23. An

AAX02695-X02708 are primers used in the isolation of a novel barley (Hordeum vulgare) hydroxyphenylpyruvate dioxygenase (HPDD) protein. This protein is useful for plant transformation to produce transgenic plants especially where an expression cassette is introduced into a plant cell, callus tissue, a whole plant or protoplasts by Agrobacterium tumefaciens transformation, electroporation or particle bombardment and where the plants are selected from soys, barley, wheat, oilseed rape, maize and sunflower, or where the DNA is expressed in tobacco plants, especially
                                                                                                                                                                                                                HPPD; barley; hydroxyphenylpyruvate dioxygenase; plant; transformation;

AAX02695-X02708 are primers used in the isolation of a novel barley (Hordeum vulgare) hydroxyphenylpyruvate dioxygenase (HPPD) protein. This protein is useful for plant transformation to produce transgenic plants especially where an expression cassette is introduced into a plant cell, callus tissue, a whole plant or protoplasts by Agrobacterium tumefaciens transformation, electroporation or particle bombardment and where the plants are selected from soya, barley, wheat, oilseed rape, maize and sunflower, or where the DNA is expressed in tobacco plants, especially
transgenic; plant cell; callus tissue, protoplast; electroporation; particle bombardment; soya; barley; wheat; oilseed rape; maize; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present sequence is a PCR primer which was used in the isolation of human breast tumour-specifc antigens. Methods for the treatment and diagnosis of breast cancer are disclosed. Nucleotide sequences that are preferentially expressed in breast tumour tissue, and the polypeptides encoded by such nucleotide sequences, are used in compositions and vaccines to inhibit the development of cancer, especially breast cancer. The progression of a cancer may be monitored by carrying out detection of
                                                                                                                                      The present sequence is given in a specification relating to compounds for therapy and diagnosis of lung cancer. Polypeptides comprising at least an immunogenic part of a lung tumour protein are disclosed. The polypeptides are useful for inhibiting the development of cancer, especially lung cancer. Samples of T cells expressing the polypeptides may be used to inhibit the development of cancer. The polypeptides also useful for detecting and monitoring the progression of cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                An isolated polypeptide comprising an immunogenic portion of a breast tumor protein used for inhibiting the development of cancer, especially breast cancer, and monitoring cancer progression in a patient -

differentially expressed genes in normal versus Fostransformed rational differentially expressed genes in normal versus Fostransformed rational differentially expressed genes in normal versus Fostransformed rational contains of deaths, to identified bit. A protein is a member of the immunoglobulin (Ig) gene superfamily, and contains (2-type Ig-like domain and on potential transmembrane domain. The predicted dft-A protein shares extensive homology with MFAPP, an extracellular protein associated with minoclopy with MFAPP, and extracellular protein associated with minochibrils. The specification describes an antibody which recognizes a dft-A protein encoded by a dft-A gene. The dft-A gene is regulated by the POS and RAS transforming pathways. The antibodies may be used to detect levels of dft-A protein expression in sample from patients according to standard immunosasy techniques (e.g. enzyme linked immunosorbant assays (ELISA)). Levels of dft-A expression can be used the content and other central nervous
tumour-specific antigens at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from the cancer patient may be treated with tumour-specific polypeptides, polynucleotides encoding the polypeptides or antigen presenting cells expressing the polypeptides. The cells are then administered to the patient to inhibit development of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Differentially expressed gene; effector gene; dft-A; FOS transforming pathway; cancer; neurological disorder; central nervous system disease; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present pNA sequence is 3' RT (reverse transcriptase)-PCR anchored primer which is used for synthesising human lung tumour-specific cDNA.
                                                                                                                                                                                                                                                   Human lung tumour-specific cDNA synthesising 3' RT-PCR anchored primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CY;

The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-cDNA tag. Inker X type in the construction of the linker X-cDNA tag. Inker Y ligated material; (d) amplification of the linker X-cDNA tag. Inker Y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the clarification of difference in function or morphology of cells under physiological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene cleantification (EGI) cDNA tag related oligonucleotide which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Construction of cDNA tags for identifying expressed genes with specific linkers and recognition sequences, applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy -

The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-cDNA fragment ligated material; (d) amplification of the linker X-cDNA tag. Inker X-cDNA tag. Interested genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the clarification of difference in function or morphology of cells under physiological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene control of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Construction of cDNA tags for identifying expressed genes with specific linkers and recognition sequences, applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cDNA tag; identification; gene expression analysis; linker; expressed gene identification; EGI; ss.

The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary decxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA tag. Inker X ligated material; (d) amplification of the linker X-CDNA tag. Inker Y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the clarification of difference in function or morphology of cells under physiological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene content of the content of genes are appresent an expressed gene content of con
Construction of cDNA tags for identifying expressed genes with specific linkers and recognition sequences, applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 14 BP; 13 A; 0 C; 0 G; 1 T; 0 other;

Construction of cDNA tags for identifying expressed genes with specific linkers and recognition sequences, applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy

Example 1; Page 24; 59pp; Japanese.

Kasai J;

Hirose K,

The present invention describes a method for constructing a cDNA tag for dentifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA fragment ligated material; (d) amplification of the linker X-CDNA tag. linker y ligated material; (d) amplification of the linker X-CDNA tag. linker y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of CDNA tags for identifying dagnesis and identifying tagoet for gene therapy, including the clarification of difference in function or morphology of cells under physiological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene identification (EGI) cDNA tag related oligonucleotide which is used in a example from the present invention.

The present invention describes a method for constructing a cDNA tag for

identifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA tragment ligated material; (d) amplification of the linker X-CDNA tag-linker Y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the clarification of difference in function or morphology of cells under physiological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene identification (EGI) cDNA tag related oligonucleotide which is used in an example from the present invention.

New secreted Frizzled-related protein-1-binding peptide, for enhancing or stimulating osteoclast differentiation or to modify T-cell activity in a subject with e.g. abnormal bone remodeling, achondroplasia or osteopetrosis

Example 1; Page 31; 81pp; English.

The invention relates to a purified peptide that binds to secreted Frizzled-related protein (BFRP)-1. The peptide is useful for enhancing or stimulating osteoclast differentiation, or to modify T-cell activity in a subject with abnormal bone remodeling, achondroplasia, Albright's osteodystrophy or osteopetrosis. The SFRP-1 is useful for inhibiting osteoclast formation in a subject with a bone disorder or unwanted bone resorption, e.g. postmenopausal osteoposis, paget's disease, lytic bone metastases, multiple myeloma, rheumatoid arthritis orhypercalcemia of malignancy. Modulating T-cell activity is useful in subjects suspected of

having toxic shock, sepsis, graft-versus-host reactions or acute inflammatory reactions. The immunostimulatory sFRP-1- binding peptide is useful in activating the immune system against bacterial, viral and parasitic infections, and in the treatment of human immunodeficiency virus (HIV). The present sequence represents a differential display (DD PCR) primer used for murine sFRP-1. 8888888888

New Zis-SR nucleic acid molecules and polypeptides, useful for restoring or increasing the secretory properties of a cell, or for treating diseases or conditions associated with a loss of function, e.g. diabetes or Parkinson's disease

70pp; English. Disclosure; Page 35;

The invention relates to an isolated nucleic acid molecule, Zis-SR, encoding a protein involved in the secretory pathway in a cell (or its homologue or variant) or nucleic acid molecules that hybridise under high condition to the Zis-SR nucleic acid. Also included are an isolated polypeptide involved in the formation of secretory granules in cells comprising the amino acid sequence spanning amino cids 243-10 of the Zis-SR protein, restoring the neuroendocrine differentiation of a cell using the nucleic acid molecule or polypeptide cids above, identifying a gene and/or protein involved in inducing regulated secretion comprising a comparison at the molecular level of a secretion-defective cell line under conditions that restore differentiation of the secretion-defective cell, such that secretion is restored, and the secretion-defective cell line in the absence of the conditions cited. Also included are modulating the secretory properties of a cell comprising modulating the activity and/or level of Zis-SR and an assay to identify a modulator of regulated secretion in a cell an assay. comprising an assessment of a biological activity of Zis-SR, its part =

                                                                                                                                                                                                                                                              ABL88472
                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                        g
or derivative in the presence of a candidate agent, where a modulator of regulated secretion is selected when the biological activity of zis-Sx, its part or derivative is measurably different in the presence of the candidate compound as compared in its absence. The nucleic acid molecules or polypeptides are useful for restoring or increasing the secretory properties of a cell, for regulating neuroendocrine phenotype, and for long term therapies to treat diseases or conditions associated with a loss of function, e.g. diabetes, neurodegenerative useful for screening compounds for treating diseases or conditions useful for screening compounds for treating diseases or conditions associated with a defect in the regulated secretory pathways in cells. The nucleic acid molecules can also be used to locate gene regions associated with genetic diseases. The present sequence is an oligo-dT PCR primer used to isolate the cDNA encoding mouse cling-dinger splicing with extended Ser-Arg domain).
                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated DNA molecule (I) encoding breast-tumour-specific polypeptides. (I) is useful as a vaccine for preventing and treating breast cancer in a subject. The polypeptide encoded by (I) is used for production of compounds such as antibodies useful in diagnosing and monitoring the progression of breast cancer. ABK46614-ABK46899 represent human breast tumour-specific coding sequences and related PCR primers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide encoding breast-specific tumour polypeptides useful vaccine for preventing and treating breast cancer in a subject -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analogosic activity. (A) along with nucleic acid (ABL88411-ABL88411) that encode proteins (B) along with hat bind oc (B), introduced proteins (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a PCR primer, used in examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chronic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                      Retinoid metabolism; retinoic acid; RA; haeme-binding motif; vitamin A; cytochrome P450; prostate cancer; drug screening; PCR primer; retinoid-regulated gene; ss.
                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to retinoid (e.g., retinoic acid (RA), vitamin A) metabolising proteins and nucleic acid sequences encoding them. RA metabolising proteins contain a haeme-binding motif which is characteristic of the group of proteins known as cytochrome P450s. The producing retinoic acid metabolising cytochrome P450s. The producing retinoic acid metabolising cytochrome P450s. The particularly useful as targets for the treatment of certain cancers such as prostate cancer. The invention also relates to a method of screening drugs for their effect on activity of RA inducible proteins. The present DNA sequence is poly (T) PCR primer which is used for isolating retinoid regularly genes by differential display of mRNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                       New DNA fragments having promoter activity, useful in retinoid metabolism, as well as in producing retinoic acid metabolizing cytochrome P450s that are useful as targets for the treatment o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to retinoid (e.g., retinoic acid (RA), vitamin A) metabolising proteins and nucleic acid sequences encoding them. RA metabolising proteins contain a haeme-binding motif which is characteristic of the group of proteins known as cytochrome P450s. The sequences of the invention are useful in retinoid metabolism and in producing retinoic acid metabolising cytochrome P450s. They are particularly useful as targets for the treatment of certain cancers such as prostate cancer. The invention also relates to a method of screening drugs for their effect on activity of RA inducible proteins. The present DNA sequence is poly(T) PCR primer which is used for isolating retinoid regulating genes by differential display of mRNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New DNA fragments having promoter activity, useful in retinoid metabolism, as well as in producing retinoic acid metabolizing cytochrome P450s that are useful as targets for the treatment o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

g them, useful for cancer, and for

```
The invention relates to novel breast tumour polynucleotides and polypeptides and polypeptides and polynucleotides are useful in pharmaceutical compositions for treating and/or preventing cancer, particularly breast cancer, and for eliciting an immune response, particularly humoral and/or cellular immune response. The polynucleotides may be used as probes or primers for nucleic acid hybridisation, in the design and preparation of riboxyme molecules for inhibiting expression of tumour polypeptides and proteins, and in recombinant DNA molecules to theory respression of a polypeptide in host cells. AAS99570-AAS99888 PCR primers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring

                                                                                                                                                                                                                                                                                     The present invention relates to retinoid (e.g., retinoic acid (RA), vitamin A) metabolising proteins and nucleic acid sequences encoding them. RA metabolising proteins contain a haeme-binding motif which is characteristic of the group of proteins known as cytochrome P450s. The sequences of the invention are useful in retinoid metabolism and in producing retinoic acid metabolising cytochrome P450s. They are particularly useful as targets for the treatment of certain cancers such as prostate cancer. The invention also relates to a method of screening drugs for their effect on activity of RA inducible proteins. The present DNA sequence is poly(T) FCR primer which is used for isolating retinoid regulating genes by differential display of mRNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Retter MW;

the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic repeats) with below simple sequences, powPoUS, and Rep-X) are luseful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogeneemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX73676-ABX80022 are the polymorphic repeats identified for a search of human ESTS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a primer used to produce human CDNA for amplification of cDNA encoding IRS-1 (insulin receptor substrate-1). IRS-1 is used to produce the compositions of the invention. The specification describes an angiogenesis-modifying composition, containing at least one a nucleic acid selected from the gene encoding IRS-1 or a molecule that inhibits expression of that nucleic acid. The composition inhibits the formation of capillary tubes by endothelial cells. The composition is used to treat and diagnose diseases associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             restenosis;

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X)m5'-(alpha)n-beta-N3', or (X)m5'-(gamma)k-delta-N3', where the sequence of a labelled compound and/or a nucleotide with voluntary sequence;

M = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine;

N = adenine, guanine, cytosine or thymine; gamma = thymine);

k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.

                                                                                                                                                                                                                                                                                                                            The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Serious of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Sthozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with requence arthurbare.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X) ms^5 - (alpha)n-beta-N3', or (X)ms^5 - (gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence;

m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, gamma = thymine or cytosine;

N = adenine, guanine, cytosine or thymine; gamma = thymine;

k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 - useful as primers in
                                                                                                                                                                                                                            RT-PCR primer; DNA sequence determination; gene sequence analysis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides having at least two new nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 15 BP; 0 A; 2 C; 0 G; 13 T; 0 other;
                                                                                                                                                                                           RT-PCR primer of the invention SEQ ID 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 10; 19pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesises to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepstitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection {\color{black} \cdot}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given
                                                                                                                                                                                                                                                                                         Substrate for HH ribozyme HCV-7901 which cleaves HCV RNA at nt. 7901.

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line.

The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites sites were identified and present degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral capitation, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to real the ribozymes may be used in combination with interferon to real the real procession and capital seases, and

The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha; see AAF57718 for the reference sequence). Polymorlacotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirabbe to decrease or block expression of a particular IL4Ralpha groups which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha.
                                                                                                     Polymorphism; human; interleukin 4 receptor-alpha; IL4R-alpha;
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide useful for the identification therapeutics in allergic diseases is new -
                                                                                                                                                                                                                                                                                                                                                                  Denton RR, Duda A, Nandabalan K, Stephens JC;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense obligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of sporiasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, beningy growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation. blood vessels or any other hyperplasia. The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The carzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the syptementary to one of the substrate sequences defined in the expression and/or ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirthosis, liver failure and/or hepatocellular carcinoma. The HCV infection in conjunction with one or more other drug therapies, carbozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme.

C substrate for a HCV hammerhead (HH) ribozyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other

specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme.
                                                                                                                                                                  New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma

disease

The invention relates to a method for haplotyping the cytochrome P450, subfamily IID, polypeptide 6 (CYP2D6) gene (ABD72215, ABQ72344) of an individual, and also describes 29 novel polymorphic sites within the human CYP2D6 gene. The CYP2D6 gene is located on chromosome 22q13.1 and character and also describes 29 novel polymorphic sites within the character in CAP2D6 gene involved in the detoxification of many drugs and environmental chemicals. It plays a role in the metabolism of drugs such antidepressants, and is also involved in the formation of a metabolite can indepressants, and is also involved in the formation of a metabolite antidepressants, and is also involved in the formation of a metabolity or expression may also influence an individual's susceptibility to environmentally-linked diseases, and it has been demonstrated that CYP2D6 environmentally-linked diseases, and it commodities of Parkinsons's disease, with individuals with a less active pathogenesis of Parkinsons's disease, with individuals with a less active form of the enzyme tending to have an earlier onset of this condition.

CC Typ2D6 mucleic acid sequences are useful in studying the expression and frug-induced lupus syndrome) or which are metabolised by CYP2D6.

CYP2D6 mucleic acids and proteins are also useful in studying the effect of polymorphisms on the biological activity of CYP2D6. Polymorphisms on the biological activity of CYP2D6. Polymorphisms on the biological activity of CYP2D6. Polymorphisms on the biological activity of CYP2D6.

RESULT 1316

ASO primer #7, used to detect human HMGCL gene polymorphisms. (first entry) 08-MAY-2002 ****

```
The present invention relates to a new polynucleotide having a sequence comprising a 3-hydroxy-3-methylglutaryl coenzyme A lyase (HMGCL) isogene, selected from 6 isogenes, and defined by a corresponding set of polymorphisms whose locations and identities are given in the specification. The method of the invention is useful for haplotyping the MMGCL gene in an individual and in design of clinical trials of candidate drugs for treating a specific condition or disease condidate drugs for treating a specific condition or disease to predicted to be associated with HMGCL activity and is useful for genotyping HMGCL gene of an individual. The method of the invention of sales and primers and for association between a trait and at cleast one haplotype or haplotype pair of HMGCL gene. ASO is useful as probes and primers and for assaying a polymorphism in the target region. The invention is useful for genotyping and/or haplotype or haploty
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; endothelin 2; EDN2; polymorphic site; PS; therapy; hypertension; drug screening; cardiovascular disorder; renal insufficiency; ASO; allele specific oligonucleotide; cerebroprotective; polymorphism; hypotensive; cerebrovascular condition; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to genetic variants of human endothelin 2 (EDN2) gene. EDN2 gene contains 17 polymorphic sites PS1-FS17. The polymorphic variants are useful in studying the expression and function of EDN2, in expressing EDN2 protein for use in screening for candidate drugs to treat diseases related to EDN2 activity, in studying the effect of the variation on the biological activity of EDN2, and the binding affinity of candidate drugs targetting EDN2 for the treatment of hypertension, cardiovascular disorders, renal insufficiency and cerebrovascular conditions. The haplotyping methods are useful in validating EDN2 as a candidate target for treating a specific condition or disease predicted to be associated with EDN2 activity, or in the design of clinical trials of candidate drugs for treating a specific condition
                                                                                                                                                                                                                                                                                           New human endothelin 2 (EDN2) polymorphic variants and encoding genes, useful in expressing EDN2 protein for screening candidate drugs to treat diseases related to EDN2 activity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human NPR1 gene allele-specific oligonucleotide sequencing primer #21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or disease associated with EDN2 activity, Allele specific oligonucleotides (ASO) are used as probes and primers, and for detecting polymorphism in EDN2 gene. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ASO primer used to detect polymorphism in human EDNZ gene.

The invention relates to single nuclectide polymorphisms in the gene encoding the human natriuretic peptide receptor A/guanylate cyclase A (arrionatriuretic peptide receptor A) or NRR1 polypeptide. A method for haplotyping the NRR1 gene in an individual comprises identifying the naplotyping the NRR1 gene is defined by one of the NRR1 haplotypes given for the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype or nat haplotype or haplotype pair of the NRR1 gene can be assigned to specific genotypes, an association between a trait and a haplotype or haplotype pair of the haplotype or haplotype pair of the haplotype pair in a propulation whichibiting the trait with the frequency of the haplotype or haplotype pair. NRR1 and its corresponding DNA are used for studying the expression and function of NRR1, for use in screening for candidate drugs to treat diseases related to NRR1 activity, such as Corraponent on the biological activity of NRR1 sequences AAS99990 affinity of candidate drugs targeting NRR1. Human CALM1 gene allele-specific oligonucleotide #10.
```

06-JUN-2001; 2001WO-US18343. WO200194600-A2. 13-DEC-2001 Hepatitis

The invention relates to an isolated polynucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALM1). The polymorphic variant comprises an CALM1 isogene defined by a haplotype selected from haplotypes 1-21 given in the specification. The polymorphisms are useful for studying the biological function of CALM1 as well as in identifying drugs targeting this protein for the treatment of a disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting CALM1 to treat a specific condition or disease predicted to be associated with CALM1 activity. Establishing CALM1 haplotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with SCYM3 activity, e.g. Alzheimer's disease and diseases involving defects in calcium-dependent signs useful in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in expressing CALM1 protein for use in screening for candidate drugs to treat diseases related to CALM1 activity such as Alzheimer's disease with CALM1 activity. AAS95892-AAS96018 represent human CALM1 allele-specific oligonuclectides and PCR primers of the invention. The invention describes an isolated nucleic acid regulatory sequence for a cyclin D1 promoter, a CD40L promoter, vancomycin-resistant enterococci (VRE) promoter. A musan epidermal growth factor receptor 2 (HRE2) promoter, or a beta lactamase (RB1a) promoter. Transcription regulatory sequences may be used to regulate expression of the endogenous, autologous or heterologous genes or perably linked to the promoter, and may be incorporated into mescar transcription regulators for use in regulated expression of transgenes. Regulated expression of cyclin D1 can be used in cancer therapies, such as breast, colon or pancreatic cancers and familial adenomatous polyposis. Regulation of the activity of CD40L gene promoter may be used in the treatment of immunological disorders, such as autoimmune diseases e.g. multiple sclerosis (MS), systematic lupus crythematosus (SLE), graft-va-host disease (GVHD) and rhematoid arthiritis. Regulated expression of genes under the control of the HBV (hepatitis B)-specific core, pre-S and X promoters can be used in the therapy of HBV disease, chronic hepatic insufficiency, cirrhosis, hepatocellular carcinoma, and in the regulated expression of liver cell-specific genes. Regulated expression of the vand gene promoter can be used in treatment of Enterococcus infection, while regulated expression of expression of the androgen receptor gene can be used in the treatment of prostate cancer. This sequence represents a mutated promoter region used in the invention to determine the regulatory regions involved in gene expression, described in the method of the invention.
                                                                                                                                                                                                                   New nucleic acid regulatory sequences, which are able to regulate expression of a gene operably linked to a promoter, useful for regulating the expression of transgenes and for treating e.g., cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 15 BP; 1 A; 4 C; 5 G; 5 T; 0 other;

Splice junction; alternative spliced mRNA, splice variant; carcinoma; sarcoma; leukaemia; lymphoma; pancreatitis; polycystic kidney disease;

21-NOV-2002.

(CHIR) CHIRON CORP. (RIBO-) RIBOZYME PHARM INC.

WO200293165-A1

The invention relates to a set of oligonucleotides, which comprise at least one oligonucleotide that specifically hybridises to each possible splice junction in mRNA transcribed from at least one gene of interest. The oligonucleotides are useful in solid supports for detecting alternative spliced mRNA, a pathological condition in a patient, or identifying an agent that modulates a pathological condition. These oligonucleotides are particularly useful for detecting or analysing alternative splice variants of mRNA, as well as for predicting disease states in the diagnosis of diseases, e.g. carcinoma, sarcoma, leukaemia, lymphoma, pancreatitis, or polycystic kidney disease. The splice variants are useful for screening pharmaceutical agents for modulating a pathological condition. This polynucleotide sequence represents an intron region relating to the invention. New sets of oligonucleotides with at least one that specifically hybridizes to each possible splice junction in mRNA transcribed a gene, useful for detecting or analyzing alternative splice variants of mRNA, Length 16; Sequence 16 BP; 1 A; 0 C; 2 G; 12 U; 1 other; Disclosure; Page 5; 37pp; English. 17-MAY-2002; 2002WO-US15649. 17-MAY-2001; 2001US-291598P. 92.98; Best Local Similarity 92.9 Matches 13; Conservative or diagnosing diseases WPI; 2003-129322/12.                                                                                                                                                                                                                          the synthesis, expression and/or stability of a mRNA encoding 1 or receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fl1-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX6775 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes nucleic acid molecules which modulate
                                                                                                                                                                                                           The present invention describes nucleic acid molecules which modulate

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase i (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AXK67275 to AAX795752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flt.1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flt, hammerhead ribozyme; hairpin ribozyme; oleavage; tumour anglogenesis; psoriasis; rheumatoid arrhritis; coular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecule modulating VEGF receptor(s) gene expression or

```
The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, pscriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAXG7275 to AAXT5752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriaais; veruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; ss. The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl Phydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin subunit beta 3 gene, and AAA1762 to AAA1762 represent ribozyme sequences for ARNY, corresponding target sequences for Tie-2 gene AAA19087 to AAA19154 to AAA19155 to AAA19155 to AAA19155 to AAA19155 to AAA19152 represent their corresponding target sequences; and AAA19152 represent their corresponding target sequences; AAA19152 to AAA191501 to AAA19155 to AAA191501 and AAA21501 to AAA21505 to AAA19155 to AAA191501 to AAA21501 to AAA21501 to AAA21695 to AAA21600 and AAA21609 to AAA21609 to AAA21601 and AAA21501 to AAA23342 represent their corresponding target sequences; AAA21609 to AAA21607 and AAA23163 to AAA23342 represent their corresponding target sequences; AAA21609 to AAA23163 to AAA23163 to AAA23343 to AAA23160 to AAA23343 to AAA23160 to AAA23343 to AAA23160 to AAA2342 represent their corresponding target sequences; the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNY, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cencer, diabetic retinopathy, age related macular degeneration (ARN), inflammation, and arthritis, as well as necowascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, and chiber syndrome, Kippel-Trenaunay-Weber sequence con and other syndrome and diseases related to the level of the 12016 of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, aryl hydrocarbon nuclear transport, ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiatribritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; vernuca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome;

```
The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor. BAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       рp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes enzymatic muclear actor molecules with a pecifically cleave RNA encoded by an arryl hydrocarbon nuclear transporter (ARNT) gene, an integrin alpha 6 subunit gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17651 to AAA17623 to AAA1888 sequences for ARNT, and AAA17167 and AAA17560 and AAA17623 to AAA1888 and AAA1987 to AAA19155 to AAA1922 represent their corresponding target sequences; AAA19155 to AAA1922 represent their corresponding target sequences; AAA19255 to AAA21920 represent their corresponding target sequences; AAA19253 to AAA21850 and AAA21850 to AAA21596 to AAA21596 to AAA21590 and AAA21595 to AAA21596 to AAA21590 and AAA21595 to AAA21596 to AAA21590 and AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequences; AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequences; CC AAA221695 to AAA2342 and AAA23263 to AAA23342 represent ribozyme sequences; AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequences; CC integrin subunit beta 3, and AAA2344 to AAA23342, AAA23343 to AAA23422 represent their corresponding target sequences. The ribozyme of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta 3, integrin subunit alpha-6, or Tie-2. They are cepecially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as cepecially allowoma, myopic degeneration, paciasis, vertuce and citebral encoding angiofabetic retinopathy, age related syndrome, Kippel-Trenaunay-Weber syndrome, Sturge Weber.

Syndrome, Kippel-Trenaunay-Weber syndrome, osler-Weber-Rendu syndrome, integrin subunit alpha-6, or ribe-arias syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or ribe-arias subunit alpha-6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes enzymatic nucleic acid molecules with

```
Identifying hematopoietic stem cells, by targeting two reporter DNAs into two different genomic loci of hematopoietic cells to produce targeted cell population, and selecting cells under specific survival
                                                                  Disclosure, Fig 4; 36pp; English.

```

ö This invention relates to a novel method for identifying haematopoietic stem cells (HSCs) involving targeting two different reporter DNAs into different functionally important genomic loci of HSCs such that reporter DNA (RD) expression is driven by genomic locus promoter into which RD is targeted, to produce a population of successfully targeted HSCs and other cells and subjecting that population to conditions so that HSCs survive and other cells do not. The method of the invention is useful for identifying HSCs and for exploring, for e.g., the conditions to expand HSCs in vitro, and to identify signal molecules that control HSC self-renewal and lineage commitment, which may provide improvements in current bone marrow transplantation and leukemia therapy. The present a DNA amplification method shown in the specification. Gaps .. 1.2%; Score 13; DB 1; Length 17; 100.0%; Pred. proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1

Disclosure; SEQ ID 1758; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDWLP-1). The protein and polymucleotide sequences of hGDWLP-1 can be used in gene therapy and vaccine production. The hGDWLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDWLP-1 nucleic acids in samples, as amplification. The hGDWLP-1 protein variants having desired phenotypic improvements, and convenient proteins. The hGDWLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hCDWLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hCDWLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hCDWLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hCDWLP-1 may be used for diagnosing a disorder associated with the expression of hCDWLP-1, in the polymucleotide disorders hCDWLP-1 may be used for concentrations. chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of brotein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 proteins variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific concentration, and hordours applement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for therapy. The protein associated with the expression of hGDMLP-1, in no particular heart and skeletal muscle disorders hGDMLP-1 in localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hobMiP-1 mucleic acids can be used as probes to detect, characterise and quantify hobMiP-1 nucleic acids in samples, as amplification constrates, to provide initial substrates for the recombinant engineering of hobMiP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hobMiP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise homomorphic and/or amount specifically of hobMiP- proteins, as standards in assays used to determine the concentration and/or amount specifically of hobMiP- proteins, as specific biomolecule capture probes for surface-enhanced laser desorption inniarion, as therapeutic supplement in patients having specific deficiency in hobMiP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hobMiP-1 may be used for diagnosing a disorder associated with the expression of hobMiP-1, in particular heart and skeletal muscle disorders. hobMiP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hobMiP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N.B. The sequence data for this patent did not form part of the printed

The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific therapy. The polymucleotide supplement in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present form part of the printed format directly from WIPO N.B. The sequence data for this patent did not specification, but was obtained in electronic fat ftp.wipo.int/pub/published_pct_sequence. Sequence 17 BP; 6 A; 3 C; 6 G; 2 T; 0 other;

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

Disclosure; Page 189; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or sequence that hybridizes to them under highly stringent conditions, or the complement to f any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents,

and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell dependantion, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymetides equence represents a tumour suppression related human fukutin oligonucleotide of the invention. 848688888888888

vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these both the polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligomucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The primers represented in AAQ23985-90 are used in PCR for the amplification of human parvovirus VP-1 and VP-2 gene fragments. Human parvovirus VP-1 and PV-2 gene fragments. AAQ23980-82. Human parvovirus VP-2 gene has the partial base sequence given in AAQ23981-82. The gene can be used to prepare a recombinant antiqen which can be used for the diagnosis of parvovirus infection by radio-immunoassay and enzyme immunoassay.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0;
                                                                                                                                                                                                                                                                                                                                                                       This sense primer is common to all human EP3 clones. It was in a PCR to clone splice variants of the EP3 receptor, in conjunction with antisense primers specific to the unique 3'-untranslated regions of the clones.

                                                                                                                                           Sequences AAV45771-V45786 are target probes designed and constructed to bind to the capture probes (AAV45755-V45770). Each of the target probes binds to only one element of the capture probe set, thus a mixture of these can be added to a capture probe array. They can be used in the method of the invention in the following areas: diagnosis, drug

ö This invention relates to a novel reconstituted cell-free translation system comprising translation factors and transfer ribonucleic acid (tRNA) species which translate exogenously added mesenger RNA (mRNA) with highly selective incorporation at each codon to form a peptide or peptidomimetic product when the system includes one or more tRNA species charged with a synthetic amino acid or amino acid analogue. The perindslation system of the invention is useful for the synthesis of peptide or protein ligands or catalysts, such as insulin, growth hormone or erychropoletin, and for pure ribosome display and pure mRNA display selection experiments. The translation process provides a simplified, A new reconstituted cell-free translation system comprising translation factors and tRNA species capable of translating exogenously added mRNAs, useful for the synthesis of peptides or protein ligands or catalysts, e.g. insulin -The present invention describes an antisense compound (1) of up to 30 nucleobases in length capable of inhibiting the expression of human Smad7. (1) has antiinflammatory and cytostatic, and is a modulator of Smad7 expression. (1) can be useful for inhibiting the expression of human Smad7 in human cells or tissues, in vitro. (1) is commonly used as a research reagent and in diagnostics for example, to elucidate the function of particular genes. (1) is also useful for distinguishing between functions of various members of a biological pathway and for research use. (1) is also utilised for diagnostics, therapeutics, prophylaxis and in kits. (1) is also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. highly purified system that offers potentially improved routes to all peptides and proteins currently synthesised by alternative routes. This overcomes the limitations of prior art, e.g. difficulty in maintaining purified components and trace contaminants or inefficient processivity. There are several advantages associated with performing peptide and protein display in a pure system, such as an expected lack of post-translational modification of peptides, lack of proteases which often cause protein degradation problem and a lack of competition from contaminants in the selection steps. The present sequence represents a splint oligonucleotide used in the mRNA display method used in
                                                                                                                                                                                                                       Gaps

The present sequence is an antisense oligonucleotide specific for endothelial nitrio oxide. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

RESULT 1346

The 3' end of this oligonucleotide carries 1,3-propanediol. The oligo is one of four oligonuclectides which were designed to specifically bind and cross-link to the duplex target sequence AAQ20004. Oligo #4 with its internal cross-linking group was less effective than the other oligonucleotides with terminal

Low adenosine (A) content antisense oligomucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -

Claim 14; Page 251; 1592pp; English.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. Comparation have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the cypression and or activity of target polypeptides associated with activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activities, compared activities, and antibodies, antibody receptors, cytokines and activity produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system compared to chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creeptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (specially pulmonary distress syndrome of condition selected from pulmonary associated with a disease or and/or bronchoconstriction) and/or lung inflammation, allergy (ise) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasconstruction, temphysem, comparation, remphysem, chronic obstructive pulmonary distress syndrome (RBS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary transplantation rejection, pulmonary infections, bronchitis, and antisense oligonucleotides used in the exemplification of tragments and antisense oligonucleotides used in the exemplification of the present invention.

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers

Claim 18; Page 441; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 158), which cargets nucleid acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergie, on the creatment of diseases associated with inflammation, useful for the treatment of diseases associated with inflammation, constitutions including lung diseases and diseases whose secondary e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, effects afflict the lungs of a subject. They can be used for treating conditions, pulmonary vasoconstriction, allergies, fibrosis, pulmonary hypertension, respiratory disertess syndrome, pain, cystic culmorary disease (COPD), and cancers such as leukaemias, lymphonas, carcinomas, and cancers which may metastasise to the lungs, including the observation of the adenosine content of the Oreast and Prostate cancer. The reduction of the adenosine content of the adenosine ceceptors causing the classe of deoxyadenosine which activates adenosine receptors causing conclude sequences given in the sequence listing from the present the invention, which correspond to SEQ ID NO:1 to 2815, and then the last

```
differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA2323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence listing.
            but the sequences
  sequences are also called SEQ ID NO:1 to 185,

modulators of lipid metabolism promoter of the ABCA7 gene, useful for identifying nacription and in gene therapy of e.g. disorders of transcription and in gene

Example 3; Page 98; 126pp; French.

The present invention relates to ABCA7 gene promoter sequences (ABC stands for ATP-Binding Cassette), which are used to identify agents (A) that modulate transcription of nucleic acids placed under control of the promoter. (A) is potentially useful for treating or preventing defects in response and inflammation. The promoters can also be used in gene therapy to control expression of therapeutic genes. Analysis of the promoter sequences can be used diagnostically, particularly to identify subjects at risk of lipid metabolism disorders. The present sequence is a pCR primer for human ABCA7, used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The probe is one of eight designed from a tryptic peptide obtd. from an 83 kD protein having cellulose synthase activity. Probe 83-1G hybridised with the gene, but all eight probes were found to hybridise with DNA from E. coli HB101 preventing the use of standard procedures utilising recombinant DNA libraries in E. coli. The enzyme expressed from the isolated gene can be used for the prodn. of a wide range of glucan polymer based prods.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The 3' end of this oligonucleotide carries 1,3-propanediol. The oligo is one of four oligonucleotides which were designed to AAQ20004. Oligo #2 has the covalent to the duplex target sequence AAQ20004. Oligo #2 has the covalent cross-linking group, i.e. NAV4-ethanocytosine, at its 3' end. An assay for crosslinked triple helix showed considerable reaction with Oligo #2 and with Oligo #1. The most complete reaction was seen with Oligo #3 (see AAQ20005) which has the crosslinking group at the 5' end. NAV4-ethanocytosine at both the 5' and 3' termini. A control oligo with no cross-linking group showed no reaction. The half-life of the cross-linking reaction for Oligo #2 was ca. 1 hr (1 microm); of the Oligo #1 showed a rate four times slower. See also AAQ20008;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
Oligonucleotide #2 able to covalently cross-link to target DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New sequence-specific non-photo-activated crosslinking agents bind to the major groove of duplex DNA and are esp. useful for treating latent infections e.g. HIV

The 3' end of this oligonuclectide carries 1,3-propanediol. The oligo is one of four oligonuclectides which were designed to papecifically bind and cross-link to the duplex target sequence AAQ20004. Oligo #1 has the covalent cross-linking group, i.e. N4N4-ethanocytosine, at its 5' end. An assay for crosslinked triple helix showed considerable reaction with Oligo #1 and with Oligo #2 (see AAQ20006) which has the crosslinking group at the 3' end. The most complete reaction was seen with Oligo #3 (see AAQ20007) having with no cross-linking group showed no reaction. The half-life of the cross-linking reaction for Oligo #2 was car in t imigrow);
              Oligonucleotide #1 able to covalently cross-link to target DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New sequence-specific non-photo-activated crosslinking agents bind to the major groove of duplex DNA and are esp. useful for treating latent infections e.g. HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligo #1 showed a rate four times slower. The sequence is that of the hybridising region of tailed probe DRB99 for use in a method for determining HLA-DR beta sub-type in a nucleic acid sample. The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification homozgous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and and identifying disease susceptible individual identity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                         The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient fms-like tyrosine kinase a condition associated with the level of the free-ptor (KDR) and/or feetal liver kinase insert domain containing angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                            Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.

```
the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fins-like tyrosine kinase 1 [filt-1], kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 [filk-1] (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAK67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more
                                                                                                                           The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mena emodian 1 or mena

receptors of vascular endothelial growth factor (VEGF). A patient furfered by the ferbal human having a condition associated with the level of the first-like tyrosine kinase 1 (filt-1), kinase insert domain containing receptor (KDR) and/or feetal liver kinase 1 (filt-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.

expression or Nucleic acid molecule modulating VEGF receptor(s) gene expressingNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

Claim 4; Page 80; 218pp; English.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient forefearably human) having a condition associated with the level of the fins-like tyrosine kinase 1 (flt-1), kinase insert domain containing angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or neceptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fit-1), kinase insert domain containing angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention. Sequence 17 BP; 2 A; 2 C; 1 G; 12 U; 0 other;
